

ABSTRACT:

A water kettle having a receptacle (1) with an inner space (2) for receiving water (3) therein and with a pouring spout (4) for pouring water from the inner space (2). The water kettle is further provided with a particle catcher (9) for catching particles from the water in the kettle. The particle catcher (9) has an inlet (11) for catching descending particles (13) which faces upwards when the kettle is in an upright position. This causes loose particles to be caught from the water and to be retained particularly effectively. Furthermore, a particle catcher for use in such a water kettle is described.
